

CRIBLE D'ÉRATOSTHÈNE

Algorigramme (version naïve)

Code Python traduisant l'algorigramme ci-dessus

```
#####
Implémentation du crible d'Ératosthène
#####
```

#Author : P. JANC

```
def primes_era(n):
    L = [numbers for numbers in range(n+1)]
    L[1] = 0
    i = 2
    while i <=n:
        k = i
        while k*i <= n:
            L[k*i] = 0
            k+=1
        i+=1
    return L
```

Code Python amélioré

```
def primes_era_optimized(n):
    L = list(range(n+1))
    L[1] = 0
    i = 2
    while i**2 <=n:
        if L[i] >= 1:
            k = i
            while k*i <=n:
                L[k*i] = 0
                k+=1
        i+=1
    return L
```
